

# Clima Fixed Interest Fund Monthly Investment Report July 2019

## Market Commentary

July saw a continuation of strong bond and share markets across the globe as central banks reaffirmed their commitment to keep interest rates low. In such an environment, investors were attracted by the superior yields available from capital markets, and this appears likely to continue for some time – perhaps until economic data suggests a severe slowdown is imminent, or corporate results disappoint expectations.

### ASX at record high

At month end, Australian stocks were trading at or close to record highs, finally eclipsing the level reached just before the onset of the GFC in November 2007. Amongst the main markets, China, France and Italy are amongst the few countries yet to breach the pre-GFC record, whereas the US and UK markets surpassed their peaks back in 2013. Indeed, the main US index, the S&P 500, is now trading around 90% higher than its previous peak in October 2007.

What held the ASX back for so long?

Gains in the ASX had been limited by a relatively high aggregate payout ratio, tight monetary policy, the strong Australian dollar and weak commodity prices between 2014 and 2017. So far this calendar year, the ASX has climbed about 20%, supported by two interest rate cuts, the return to government for the Liberal National Coalition, a bottoming in the residential property market, and surging commodity prices (particularly iron ore).

The ASX has heavy representation from financial stocks and resource companies: a strong rally in big banks, and powerful performances from the major diversified miners (BHP and RIO), has fired up the index. High dividends (the ASX/S&P 200 index yields on average around 4.5%) have also attracted investors, who are struggling for yield in an ultra-low interest rate environment.

### Wall Street at record high

Wall Street's main indices closed at or near record highs at month end following the Federal Reserve bolstering expectations of interest rate cuts during August. The markets expect the Fed will reduce its policy rate by 0.25% in what has been dubbed "an insurance cut". The promise of new stimulus measures has boosted prices of Treasuries and shares, with investors betting US borrowing costs will stay lower for longer than they thought just months ago.

The US economy is enjoying its longest uninterrupted stretch of expansion since the 1850s, despite the eurozone crisis, slowdown in China, and trade wars. Recessions are typically defined as two consecutive quarters of shrinking gross domestic product. The National Bureau of Economic Research (NBER) – the semi-official arbiter of US booms and busts – reckons the current expansion started in June 2009. That means that last month the US expansion hit its 121st month, making it more than twice as long as the average post-WWII expansion.

This year, the US economy expanded at an annualised rate of 3.2% in the first quarter but has since slowed to a rate of 2.1% in the second quarter.

Some commentators worry that the expansion will probably end soon. As uncertainty around trade policy remains unresolved, manufacturing data around the world drops markedly, and

inverted yield curves signal disturbing trends, concern about the outlook is becoming more pronounced. Business confidence and corporate investments have slowed to multiyear lows.

### Major institutions like the World Bank and the IMF highlight trade tensions

According to the World Bank's economists, "Global growth has continued to weaken and momentum remains fragile. Downside risks to growth predominate, including rising trade barriers, a build-up of government debt, and deeper-than-expected slowdowns in several major economies." The post GFC recovery has been weaker than most other economic recoveries since the second world war. US GDP is now about 20% bigger than its pre-GFC peak. In contrast, the 1990s boom increased the size of the US economy by about 40%.

The International Monetary Fund (IMF) has cut its growth forecasts for the global economy for this year and next. It says there is an urgent need to reduce trade and technology tensions. It predicts growth of 3.2% in 2019, down from its April forecast of 3.3%.

The IMF listed the principal risk factor to the global economy as being "further US-China tariffs, US auto tariffs, or a no-deal Brexit – all of which could sap confidence, weaken investment, dislocate global supply chains, and severely slow global growth below the baseline".

### Global manufacturing recession

A major economic concern is the global manufacturing slowdown. Manufacturing indicators are showing worsening conditions across the globe, especially in the US, China, Japan and Europe. Pressures in the auto sector and concerns over tariffs have played a big role. The global manufacturing Purchasing Managers' Index (PMI), a survey of manufacturer sentiment, suggests a global manufacturing recession.

So far, the downturn has been concentrated in manufacturing, while the much larger services sector has shown resilience. Services tend to be less cyclical than manufacturing, and the expansion of services output and employment is one reason why the economic cycle has been so elongated.

High levels of employment and rising household incomes, characteristic of the late stages of the business cycle, have combined to sustain services sector growth over the last nine months. But it is unclear if the services sector can continue to keep the economy out of recession if manufacturing continues to contract.

### The global economy is soft, even as markets rise

Share market valuations are not at extreme levels, but they are above historical averages. High valuations are also why equity markets would be vulnerable to earnings disappointments.

Extreme valuations are not in themselves usually the cause of collapse in share markets. Typically, bear markets in Australian shares (a fall of more than 20%) follow declines in US markets. Over the last six decades, the ASX All Ordinaries Index has suffered 8 bear markets, where stocks fell

## Market Commentary

on average by 37%, and lasted on average for 16 months. Bear markets have typically occurred every 7 or 8 years.

US bear markets usually coincide with American economic recessions. Past experience shows correlations between recession, rising bond prices (falling yields) and declining share prices. If the US economy experiences a recession, and corporate earnings collapse, it seems likely that stock prices in the US (and probably also in Australia) will fall as well.

The four most useful indicators of an imminent recession in the US are: a rapid increase in the unemployment rate; an inverted yield curve; and sharp falls in the ISM manufacturing index and consumer sentiment. Employment remains strong at present, with the unemployment rate at a 50-year low. However, the yield curve is inverted and sending a troubling message, and both the manufacturing and the consumer sentiment measures are flashing yellow.

While central banks maintain their dovish stances, investors will probably continue to embrace risk-taking, even if it means share prices are expensive. But we should pay attention to the various risks, including the slowdown of growth rates (especially manufacturing and more importantly, services), the difficulty of further reducing interest rates from already ultra-low levels, and rising trade and geopolitical tensions. For equity markets, the weaker macro environment has not yet had a material impact on earnings, but this may become evident in the next reporting season.

A recession is far from inevitable - but the capacity for a decisive response (such as occurred in 2008/9) has been reduced. Back then, central banks either cut rates, bought up bonds, extended government backing to the financial sector, or did all of those things. This time around, it may be more difficult.

Thank you for your continued support of Clime.

## Clime Fixed Interest Fund

Interest rates across multiple durations continued to decline as investors' expectations of more rate cuts grew. The consensus is currently pricing in 2 more rate cuts of 0.25% each by mid to late 2020. The Australian 10y bond yield continued to drop (the bond price rallied) and touched all-time lows almost on a daily basis towards the end of July; it finished at 1.19% at month end from 1.32% at the beginning of the month.

In July, the Fund was actively becoming more invested. The Fund is now diversified across senior investment grade (IG) debt to high yield (HY) unrated corporate bonds. We have also begun to introduce a small exposure to RMBS. As the Fund is in its infancy and not fully invested, we intend to keep the investment profile at the shorter end of the curve (5 years or less) until we see opportunity emerging.

In July, we participated in three senior banks' FRNs: the TD Bank and Suncorp 5y and ME Bank 3y senior FRNs. We invested in the primary issuance of ANZ T2 subordinated FRNs and bought four subordinated T2 FRNs of DBS, IAG, SUN and WBC with call dates ranging from 3 to 4 years. We seek to take advantage of the increased capital adequacy requirement by the regulators, APRA, on the major ADIs regarding the TLAC (Total Loss Absorption Capacity). This resulted in an increase of approximately \$80B additionally funding over 4 years, which will predominantly be sourced from subordinated T2 debt. The announcement in early July by APRA caused a 10 to 20 bp widening of these and similar issues, whereupon we seized the opportunity to invest. We note that the spread has since recovered almost completely.

At month end, the asset allocation was 18.9% cash (including term deposits), 40.0% IG senior bonds, 36.1% IG subordinated FRNs, 4.5% HY unrated corporate bonds and 0.5% RMBS. At 31 July 2019, we had not yet invested in Capital Notes and Income Securities.

With the cash rate at 1.0%, the running yield for the portfolio is low and will remain low. This is exacerbated by the fact that the Fund is not fully invested. Investors should be aware that in the first few months, monthly distributions may be sporadic and uneven due to the nature of the Fund (as interest distributions can only be made on a cash basis). In other words, the Fund cannot make any distributions until the interest from investments have actually been received. That said, the portfolio registered a positive return of 0.45% for July, mainly as the result of accrued interest on investments made but not yet received.

## Snapshot

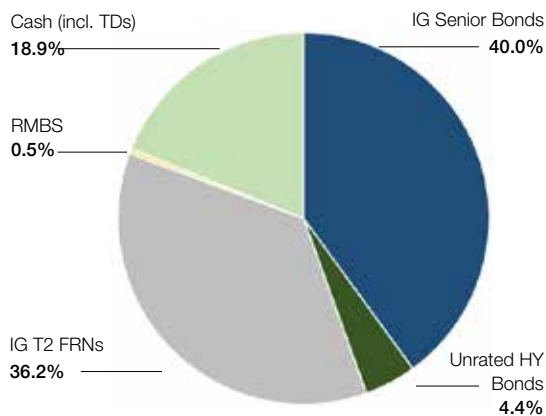

## Performance and Volatility of Return (31/07/19)

	1 month	3 months	6 months	1 year	2 years	3 years	Inception
Portfolio Return <sup>^</sup>	0.4%	1.3%	-	-	-	-	1.3%

<sup>^</sup>Portfolio return is based on the change of the unit price including distributions but excluding franking credits.

<sup>\*</sup>Inception: Wholesale Units: 17 April 2019. Performance figures for more than 1 year are annualised, calculated after all applicable fees and taxes. Performance figures compare unit price to unit price for the given period. The returns do not include the benefit of franking credits.
